ATTY-AGENT-FIRM: Jones, Tullar & Cooper PC

ABSTRACT:

A revenue management software system supports decisions to accept or deny requests for resource capacity (seats, rooms, volume/weight, air time, etc.) using control logic that accesses multidimensional lookup tables of price values for each resource (flight leg, hotel day, etc.). Each dimension of each lookup table corresponds to a variable that affects the value for the resource. As an example where the resource is airline seating capacity for a given flight itinerary, a two-dimensional threshold value table is employed for each flight leg in the itinerary where the first dimension specifies the current time slot and the other dimension the current number of reservations accepted (reservation level) for the flight leg. A request for a seat on the flight is accepted if and only if its net revenue exceeds or equals the sum of the current table values (i.e. the table entries corresponding to the current time and current reservation level) for each requested flight leg.

ATTY-AGENT-FIRM: Morgan & Finnegan, L.L.P. Brandt; Jeffrey L.

ABSTRACT:

A conditional purchase offer (CPO) management system is disclosed for receiving CPOs from one or more customers, such as cruise and airline passengers, and for evaluating the received CPOs against a number of CPO rules defined by a plurality of sellers, such as cruise operators and airlines, to determine whether any seller is willing to accept a given CPO. A CPO is a binding offer containing one or more conditions submitted by a customer for purchase of an item, such as airline travel, at a customer-defined price. A CPO rule is a set of restrictions defined by a given seller, such as a cruise operator or an airline, to define a combination of restrictions for which the seller is willing to accept a predefined price. The CPO rules may be securely stored by one or more servers. The CPO management system permits a seller to correct for forecasting errors, if necessary, or other competitive forces which have produced excess capacity, by providing inventory for sale to CPO customers. If a CPO is accepted by more than one seller, the CPO management system executes a post-sell multi-bind process to permit each accepting seller to directly market to the customer and post-sell their product. Thus, the customer selects for himself which seller acceptance to utilize, based on materials furnished by each seller. The CPO management system may optionally also provide a CPO which specifies preferred sellers to the excluded sellers who may make counteroffers to the customer, in an attempt to obtain the business, before one of the specified sellers accepts the CPO.

ABSTRACT:

An automated service upgrade offer acceptance system is provided for receiving (i) reservations for a selected category of assigned services, such as seating, and (ii) offers for upgraded services, such as an upgrade of an initially selected category of seating to a preferred seating category, from confirmed customers. The automated service upgrade acceptance system permits customers to submit offers for a number of upgraded services or upgrade offer items, including offers for an upgrade of an initial category of seating to a different seating category, including premium seats within a given category of seating, as well as other premium services, such as priority for special meals or drinks, priority for receipt of luggage upon deplaning, and discount companion tickets. The automated service upgrade acceptance system allows a customer to place a binding offer for an upgraded offer item, should the item become available. Offers for upgraded services can be accepted by the automated service upgrade acceptance system at any time during a seller-defined offer acceptance period, from the time of making a reservation, up to a predefined expiration period. The automated service upgrade acceptance system processes the received offers for upgraded services, at one or more intervals until an offer acceptance period expires, to determine whether to accept or reject each offer for an upgraded service and thereafter notify the customers of any revised seating assignments. The received offers for each different upgrade offer item are preferably processed in a predefined sequence, such that offers for the highest categories of seating are processed first. The automated service upgrade acceptance system can enhance the value of offers in accordance with seller-defined criteria for preferred customers, such as frequent flyers, or in accordance with a promotional offer.

ABSTRACT:

The present invention relates to an inventory control method and architecture that maximizes revenues derived from the sale of a given inventory resource to a customer. More particularly, the present invention uses a continuous nested execution environment that allows a determination of a minimum acceptable price by continuously computing an optimal sale price based on current demand and supply and expected cancellations. The method described accesses a centrally located information repository and retrieves an inventory resource type and value allowing requests below the minimum acceptable price to be rejected, while requests above the minimum acceptable price can be accepted thus allowing the resource provider to maximize incoming revenues from the sale of its inventory of reservations.

ABSTRACT:

Computerized travel reservation information and planning system that generates "map ticket" output in various media, for guidance and transactions en route. Such print or electronic documents can include bar or alphanumeric codes for automated recognition and/or access. WHERE?, WHO/WHAT?, WHEN? and HOW? menus enable flexible user inquiries accessing selectable geographic, topical, temporal and transactional data records and relational processing. Sub-menus provide further capabilities: e.g. routing, topical searching; searches of events calendars, almanacs, appointment books, related itinerary

scheduling; trip budgeting issues, plus travel arrangement availabilities or other goods/services offers. Online communications links access updated or supplemental information on places, times, topics and other provider goods/service offers. Online computer-aided routing system enables input of selectable travel origin, destination, and waypoints to compute travel routes, available transportation services, costs, options, and schedules. A point-of-interest database lets users pick types of attractions or accommodations within a user-selected region around routes of travel. Users engage in an iterative planning process, revising or editing travel plans, previewing travelogs of alternate routes, selecting point of interest parameters, comparing times and costs of transportation options, in order to achieve a satisfactory travel plan. The system provides printed or electronic output that may include any one or more of text itinerary, ordered set of travel maps, customized collection of information on points of interest information and a selected array of valid reservation confirmations, tickets and/or discount coupons coded with elements for automated recognition and processing. Mobile users, including GPS-linked users, can access the system via wireless communication units.

ABSTRACT:

A system for controlling travel primarily in a corporate environment that interconnects travelers, travel agents and airline CRSs so that a traveler can communicate with the CRS with a user friendly GUI to obtain schedule information and transfer such to a travel agent, the travel agent can use the selected schedule information for ticketing and to assure the lowest cost while the entire trip information is stored locally for management control. The system includes multiple connects to the CRS to overcome data transfer limitations specific to airline CRSs.

ABSTRACT:

Insures data integrity in process ownership indications by providing an ownership interlock on the data units in a pipeline to a store-in type of cache. An ownership interlock prevents any processor ownership change to occur (i.e. exclusive or readonly ownership) for a cache data unit until all outstanding stores have been made in the cache data unit, after which the ownership may be changed. An ownership change may be signalled by a cross-invalidate (XI) signal to a processor. Outstanding stores are received by the pipeline after the stores are completed by a processor, and the outstanding stores output from the pipeline into a store-in cache. A continuous flow of stores is enabled into and out of the pipeline to expedite a change of ownership requested of a data unit in the cache. The continuous flow avoids having to stop a processor from putting stores into the pipeline and avoids forcing all outstanding stores out of the pipeline into the cache before indicating a change of processor ownership.

ART-UNIT: 232

PRIMARY-EXAMINER: Rudolph; Rebecca L.

ABSTRACT:

A method of maintaining the consistency of cached data in a client-server database system. Three new locks--a cache lock, a pending lock and an out-of-date lock--are added to a two-lock concurrency control system. A new long-running envelope transaction holds a cache lock on each object cached by a given client. A working transaction of the client works only with the cached object until commit time. If a second client's working transaction acquires an "X" lock on the object the cache lock is changed to a pending lock; if the transaction thereafter commits the pending lock is changed to an out-of-date lock. If the first client's working transaction thereafter attempts to commit, it waits for a pending lock to change; it aborts if it encounters an out-of-date lock; and otherwise it commits.
